Creating a gluten-free eating plan with foods that have a low glycemic index, or GI, can be a balancing act. Gluten is a protein found in wheat, rye, barley and possibly oats that causes a severe autoimmune reaction in people with celiac disease.

The starchy vegetables and grains that replace foods with gluten may have a high GI value, meaning that they can raise your blood sugar quickly after you eat them. Whether you have celiac disease or are eating gluten-free foods for other dietary reasons, you can keep your blood sugar stable by emphasizing low-GI gluten substitutes and increasing your intake of foods that are naturally gluten-free.

Glycemic Index

The glycemic index evaluates the effects of foods on your blood glucose levels. Foods that rank high on a scale of one to 100 raise your blood sugar rapidly, while foods that rank in the middle or at the lower end of the scale will have a less dramatic effect.

Slow cookers are among an array of old kitchen gadgets making a comeback. Most of us are experiencing the joys of cooking delicious readymade meals at home. The extended cooking times allow better distribution of flavors in many recipes.
