Problem solving is an essential part of every scientific discipline. It has two components: (1) problem identification and formulation, and (2) the solution to the formulated problem. One can solve a problem on its own using ad hoc techniques or by following techniques that have produced efficient solutions to similar problems. This requires the understanding of various algorithm design techniques, how and when to use them to formulate solutions, and the context appropriate for each of them.

Algorithms: Design Techniques and Analysis advocates the study of algorithm design by presenting the most useful techniques and illustrating them with numerous examples — emphasizing on design techniques in problem solving rather than algorithms topics like searching and sorting. Algorithmic analysis in connection with example algorithms are explored in detail. Each technique or strategy is covered in its own chapter through numerous examples of problems and their algorithms.

Readers will be equipped with problem solving tools needed in advanced courses or research in science and engineering.

Duane Sills:

As a university student exactly feel bored in order to reading. If their teacher expected them to go to the library in order to make summary for some e-book, they are complained. Just tiny students that has reading's internal or real their passion. They just do what the educator want, like asked to go to the library. They go to there but nothing reading seriously. As we know that on this time, many ways to get whatever we really wish for. Likewise word says, ways to reach Chinese's country. So , this Algorithms:Design Techniques and Analysis(Revised Edition) (Lecture Notes

Series on Computing) can make you experience more interested to read.
